PARTICLE PHYSICS

Mass by numbers

Frank Wilczek

A highly precise calculation of the masses of strongly interacting particles, based on fundamental theory, is testament to the age-old verity that physical reality embodies simple mathematical laws.

In a milestone paper, Dürr *et al.*¹ report a first-principles calculation of the masses of strongly interacting particles (hadrons, such as the proton), starting from the basic equations for their constituent particles (quarks and gluons), and including carefully documented estimates of all sources of error. Their results, published in *Science*, highlight a remarkable correspondence between the ideal mathematics of symmetry and the observed reality of the physical world.

Quantum chromodynamics (QCD), the theory of the so-called strong force or strong interaction, postulates elegant equations for

Figure 1 | Theory meets experiment. The masses of light hadrons (expressed in energy units; 1 MeV corresponds to 10^6 electronvolts)

quantum fluctuations, or ‘virtual particles’. In the mathematical formulation, there is a master wavefunction for the quantum fields. The wavefunction is a superposition of different possible patterns of excitation in the fields, each occurring with some definite amplitude. The central problem involved in solving the equations of QCD, to predict the census of hadrons and their properties, is to compute this wavefunction: that is, to determine the numerical value of the amplitudes. Having constructed the wavefunction of ‘empty space’, we can inject different combinations of quarks and

Force between particle

□ Yukawa potential

$$\left(\nabla^2 - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \lambda^2 \right) V(r) = 0$$

$$mc^2 \cdot r/c = \hbar \quad \text{or} \quad mc = \lambda \hbar$$

mass given by uncertainty principle

1949 Nobel prize

Force by exchanging scalar meson (pion)

$$V(r) = -g^2 \frac{e^{-\lambda r}}{r} = \frac{1}{(2\pi)^3} \int e^{ikr} (-g^2) \frac{4\pi}{k^2 + \lambda^2} d^3k$$

Matter is composed of fermion

matter is fluctuation in vacuum
(色即是空)

Three Generations of Matter (Fermions)

	I	II	III

Bosons (Forces)

only one fermion of same quantum state can occupies the same place at given time

Fermion : Spin $\frac{1}{2}$, ... (half integer)

-Pauli exclusion principle

-follows Fermi-Dirac statistics

$$n_i = \frac{g_i}{e^{(e_i - e_0)/kT} + 1}$$

Boltzman statistics

fill from low energy state

Boson : Spin 0, 1, ... (integer)

- force carrier

- follows Bose-Einstein statistics

$$n_i = \frac{g_i}{e^{(e_i - e_0)/kT} - 1}$$

thermal disturbance

Hadron

- ❑ Meson is quark-antiquark pair
- ❑ Baryon is a 3 quarks system

- ✓ We cannot observe Quarks due to Color force, but we observed Baryon and Meson.

Meson (Spin)

Nucleon Interaction

Higgs boson

❑ Origin of mass ?

- Standard model is correct below 100 GeV.
- Why W and Z have masses ?
- Mass of H is 140 ~ 1,000 GeV ?

❑ Will CERN LHC find Higgs ?

- 7 TeV is sufficient for finding Higgs.

Compton scattering

Mass zero particle

$$p = E/c$$

$$E = h\nu$$

photon
quanta

Energy Conservation

$$h\nu + mc^2 = h\nu' + \frac{mc^2}{\sqrt{1 - u^2/c^2}}$$

Momentum Conservation

$$\frac{h\nu}{c} = \frac{h\nu'}{c} \cos\beta + \frac{mu}{\sqrt{1 - u^2/c^2}} \cos\alpha$$

$$0 = -\frac{h\nu'}{c} \sin\beta + \frac{mu}{\sqrt{1 - u^2/c^2}} \sin\alpha$$

before collision

after collision

$$m(\nu - \nu') = \frac{h}{c^2} (1 - \cos\beta) \nu \nu'$$

$$\lambda' - \lambda = \frac{2h}{mc} \sin^2 \frac{\beta}{2}$$

$$\Delta\lambda_{\max} = \frac{h}{mc}$$

$$\lambda_e = 2.4263102175(33) \times 10^{-12} \text{ m}$$

$$\nu = \frac{c}{\lambda}$$

Compton wave
length

particle position cannot be
determined below this limit !

Planck particle, Planck units

When Compton length is same as the Schwartzschild diameter

$$l_P = \frac{h}{m_P c} \propto 4 \frac{\kappa m_P}{c^2}$$

$$g_{rr} = 1 + \frac{2\kappa m/c^2}{r - 2\kappa m/c^2}$$

Planck mass

$$m_P \equiv \sqrt{\frac{\hbar c}{\kappa}} \simeq 1.221 \times 10^{19} \text{ GeV}/c^2 = 2.176 \times 10^{-8} \text{ kg}$$

Planck length (size of Schwarzschild radius)

$$l_P = \sqrt{\frac{\hbar \kappa}{c^3}} \simeq 1.616 \times 10^{-35} \text{ m}$$

Planck time (light travelling time over Planck length)

$$t_P = \sqrt{\frac{\hbar \kappa}{c^5}} \simeq 5.391 \times 10^{-44} \text{ s}$$

! Higgs mass of 1000 GeV/c² is not enough for a small black hole.

10¹⁵ heavier than a proton
10⁻²⁰ smaller than a proton

How to measure mass ?

□ Cyclotron resonance

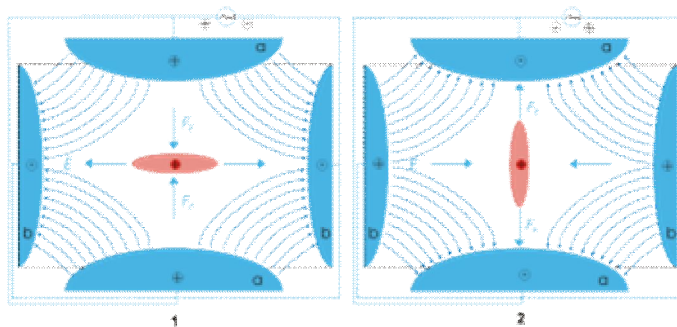

$$\mathbf{F} = q(\mathbf{E} + \mathbf{v} \times \mathbf{B})$$

Lorentz force

$$\mathbf{F} = m\mathbf{a}$$

$$\omega_{ce} = \frac{qB}{\gamma m_0}$$

Relativistic correction

Paul Ion Trap (1989 Nobel prize)

Penning Trap

$$\frac{m_p}{m_e} = 1836.152\,672\,47(80)$$

Measured Atomic Mass

Masses of more than **1100**
Nuclides were measured
Mass accuracy:
SMS $1.5 \cdot 10^{-7}$ up to $4 \cdot 10^{-8}$
IMS $\sim 5 \cdot 10^{-7}$
Results: **~ 350 new masses**
In addition more than
300 improved mass values
